

# Project Building Table Relationships with Excel's Data Model

1) In **Diagram View** of the data model, use the "**Manage Relationship**" window to delete all existing table relationships

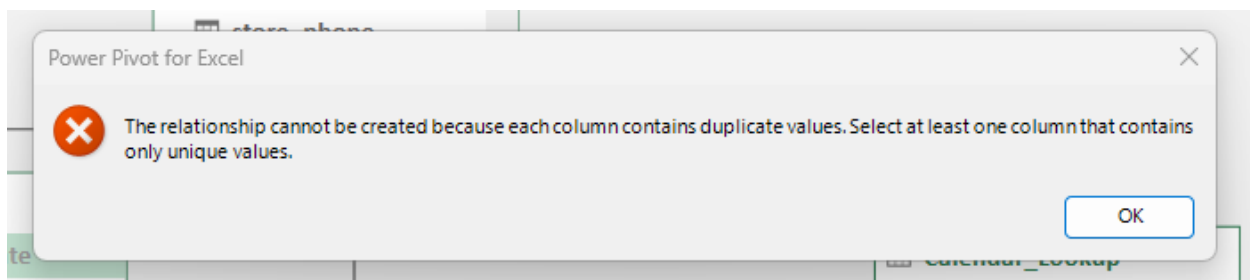

2) In **Diagram View**, draw out each relationship to recreate the fully connected data model:

- Connect **Transactions** to **Customer\_Lookup**, **Store\_Lookup** and **Product\_Lookup**
- Connect **Transactions** to **Calendar\_Lookup** on both *transaction\_date* (**active**) and *stock\_date* (**inactive**)
- Connect **Returns** to **Store\_Lookup**, **Product\_Lookup** and **Calendar\_Lookup**
- Connect **Store\_Lookup** to **Region\_Lookup**

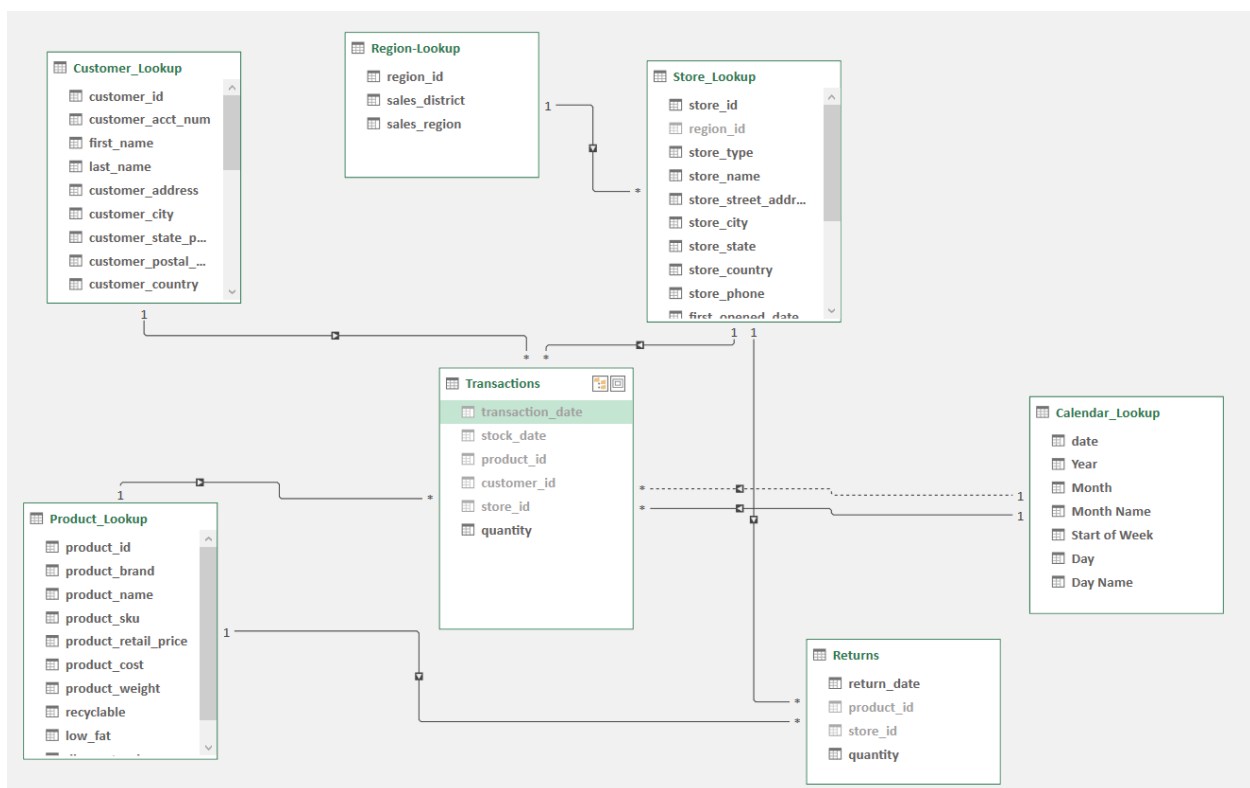

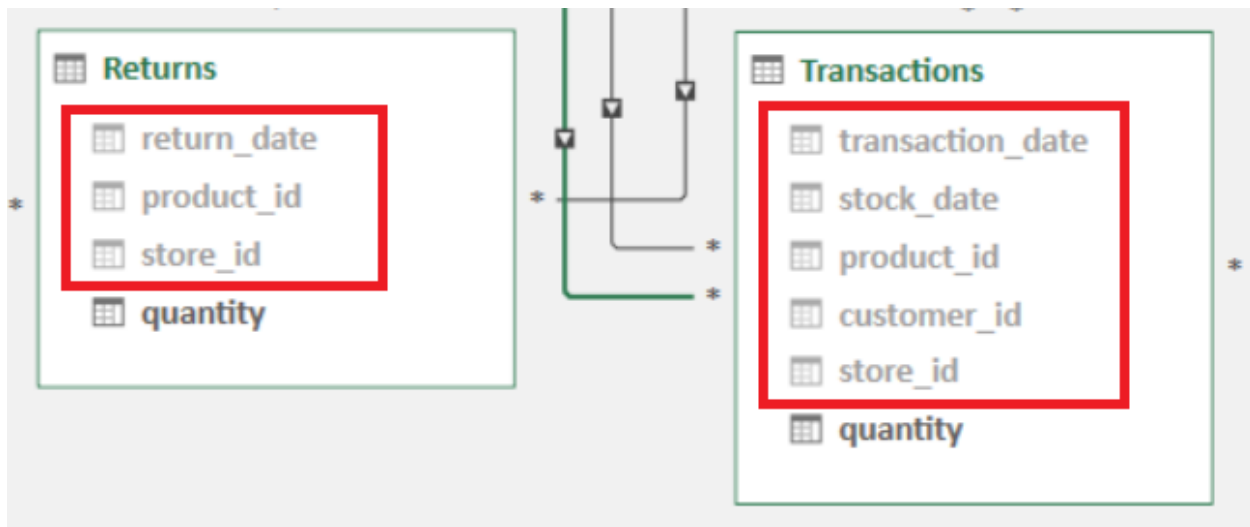

3) Try creating a relationship between *Transaction\_Date* and *Return\_Date*. What happens, and why?

→ The relationship cannot be created because each column contains duplicate values. This represents a "many-to-many" relationship

4) Hide all foreign key columns in the **Transactions** table using the **Diagram View**, then hide all foreign key columns in the **Returns** table by selecting the column headers in the **Data View**.

5) Create a **hierarchy** in the **Product\_Lookup** table named *product\_set*, containing *product\_brand*, *product\_name*, and *product\_sku* (in that order)
